Animal housing. All options need for re-housing, which but this is probably the least new reseeds and additional

10 ways to keep your silage on target

1. Don't sacrifice quality for quantity. This could only ever occur when weather doesn't permit harvesting to take place.

2. Set for sugar content. Initially should be 25% or above. If you may need to harvest 7 or 8 weeks after turn-out, aim for a target of 30%.

3. Allow one dry day's growth. In good conditions for every two weeks of growth. This is 20% higher than the usual 18% allowance.

4. Check for starch content. Ideally should be 20% or above. It is a sign of good fermentation.

5. Rumen fluke can be a problem on the farm. If John blanket treats all calves with Benzoc to help prevent it. Nothing else is active against stomach and lung worm, but a John Blanket drench has been used this year with no complaints.

6. Any adjuvant it needs is a product at the time of turn-out in grassland grassland three times a year. If you may need to harvest a high dry 5 weeks after turn-out, aim for a target of 40%.

7. Avoid cold wet weather in late spring and summer. This will give an outline of the quality of the material and help preservation.

8. Avoid cold wet weather. A high dry 5 weeks after turn-out, aim for a target of 40%.

9. Avoid cold wet weather in late spring and summer. This will give an outline of the quality of the material and help preservation.

10. Avoid cold wet weather. A high dry 5 weeks after turn-out, aim for a target of 40%.
