

Ballyhaise Weekly Farm Notes - Monday 5/10/2009

A. Critical Issues

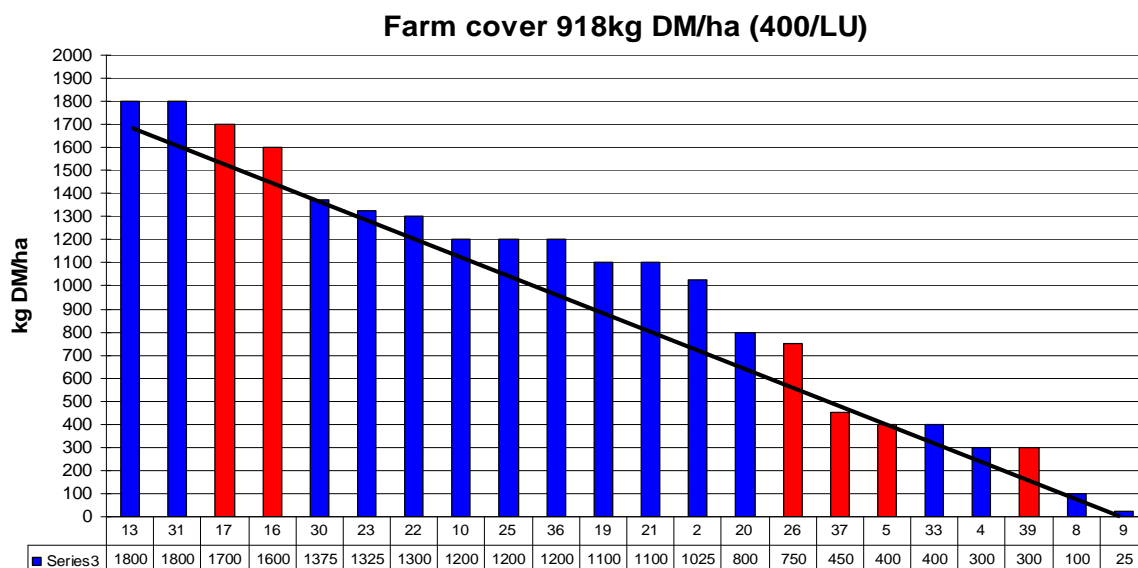

1. Maximise cow intakes of pasture and maintain residual at 3.5cm.
2. Ensure cows are getting better fed each week.

B. On farm situation

1. Soil temperature today is 14.5°C.
2. Total weekly rainfall is 2.4mm.
3. Average growth was 46kgDM/ha/day, (13% DM).
4. Demand is 27kgDM/ha/day (2.29SR * 12kgDM/cow/day).
5. Grass supply is above target (400 vs. 385/cow).
6. Feeding 1kg of concentrate.
7. Autumn budget.

8. Farm feed wedge (5/10/09).

9. Empty cows and cull cows have been sold off this week. This reduces the stocking rate on the farm to 2.29 cows/ha. We felt this was our best option as it avoids feeding excessive levels of expensive concentrates to maintain rotation length. Also, since silage supplies are below budget we want to minimise the amount of silage fed before drying off.
10. The red paddocks on the wedge are the wettest paddocks on the farm, they will be grazed first during dry periods once they are in the top third of the wedge. This will help minimise pasture damage on these paddocks during wet periods.
11. Rotation length is 42 days.
12. Post grazing height on the last paddock grazed was 3.7cm.
13. Total N usage for the year is 257kg/ha.
14. Cows were scanned last week. 18% empty rate after 12 weeks of breeding. The six week in-calf rate is 57%.
15. Average milk yield is 13.12kg at 4.57% fat and 3.74% protein (1.08kg MS/cow), lactose 4.63%, SCC 211k, TBC 2k.

C. Critical short term actions :

- Allocating grass in 12hr blocks.
- 1kg concentrate being fed.

Objective of Dairy Production Research in the Northeast:

To increase the profitability of milk production per hectare in the BMW region through improved pasture management and utilisation in combination with genetic improvement using the Economic Breeding Index.
