Hog Production Accounts for ~6% of Total U.S. Agricultural Sales

- Iowa is the leader in pig production
 - 6.8 billion in pig sales, 2012 census
- Total inventory of breeding and market pigs at 21.8 million (2016)
- Iowa State University supports this industry
- 40+ faculty across all to investigate industry production issues (examples)
 - Feed efficiency
 - Metabolic malfunction and Disease
 - Reproductive efficiency and herd longevity

U.S. = 5.7%

Iowa Select Farms

Sows
172,000 to date

- No. 8 in pig production in U.S.

- 10% of all pigs produced in Iowa come from ISF

Finishing
- 1.57 billion pounds of pork sold in 2016
- 3.7 million pigs sold

Wean to Finish
800+ sites

Commercial Production and Maternal Diets

- Feed 70% of operating costs, with protein 30% of diet costs
- Amino acid requirements of the developing fetus change with gestational age (Wu et al., 1999; NRC, 2012)
 - Fetal growth and development influences birth weight, later growth performance
 - Importance of Arginine (ARG) in fetal and neonatal pig development

Table 3 Effects of maternal dietary arginine supplementation during pregnancy on litter size and birth weights of piglets in swine

Authors	Party of pregnancy	Supplemental arginine (% of diet or g/lvs per day)	Treat of arginine (g/kg)	Amount of dietary intake per day (kg)	CP (g/kg)	Energy (kcal/kg)	Arginine content in basal diet (g/kg)	Lysine content in basal diet (g/kg)	Practical weight during early to mid gestation ^a or at birth ^b	Litter size of viable fetuses ^c or live-born piglets ^d	Litter weight of viable fetuses ^c or live-born piglets ^d
Boval and Bee (2009)	1	0.87 % or 21.7 g	4 14-28	3.0	14.3 ^b	11.5	1.07	0.88	No effect ^a	↑ by 3.7 ^b per litter ^c	↑ by 32.9 ^b per litter ^d
Campbell (2009)	1 and MP	1 % or 25 g	4 14-28	ND	ND	ND	ND	ND	↑ by 1 per litter ^a	↑ by 6.4 ^b per litter ^c	ND
De Blasio et al. (2009)	1	1 % or 25 g	4 17-33	2.5	ND	ND	ND	ND	↑ by 1.2 ^a	ND	ND
Guo et al. (2012)	1 and MP	0.8 % or 16.6 g	4 22-114	21.0 ^b	22.96 ^b	13.2	13.0	0.88	↑ by 16 ^b	↑ by 1.1 per litter ^a	↑ by 11 % per litter ^c
Li (2011)	1	0.40 % or 8.0 g	4 14-25	2.0	12.0	12.9	0.70	0.57	↑ by 34 ^b	↑ by 2.2 per litter ^a	No effect ^c
Li (2011)	1	0.80 % or 16.0 g	4 14-25	2.0	12.0	12.9	0.70	0.57	↑ by 21 ^b	↑ by 1.7 per litter ^a	No effect ^c
Mason et al. (2007)	1	0.83 % or 16.6 g	4 30-114	2.0	12.2	13.0	0.70	0.58	ND	↑ by 2.0 per litter ^a	↑ by 24 % per litter ^c

Zhu-Rush et al. (2012)	MP	1.23 % or 27.6 g	4 18-34 or 4 28-115	ND	ND	13.8	ND	0.51	SD	No effect ^a	No effect ^c

Academic Trials in Support of Arginine Supplementation

Academic Trials in Contradiction of Support

Wu, 2013

Why feed arginine at all?

- Key in urea synthesis and disposal of excess nitrogen, it is
- Utilized in polyamine synthesis and nitric oxide synthesis in uterine lumen
- Numerous metabolic processes within the trophectoderm and liver
 - Key role in trophectoderm development through SLC7 family receptors
- Contributes to cellular functions such as MTORC1
- Specific role in activation of caspase proteins direct regulation of MTOR and cellular proliferation processes
- All of these contribute to the overall goal of fetal development in cellular proliferation, differentiation, and communication

Wu et al., 2009; Bazer et al., 2011; Wu, 2013; Wang et al., 2014; Gai et al., 2016

Objectives

- Benefit of additional ARG in commercial production and on offspring performance remains unclear
- Objectives
 - To evaluate supplementation of L-ARG (at 1% inclusion, as fed) at different stages of gestation
 - Determine its influence on offspring performance in commercial swine production

Materials and Methods

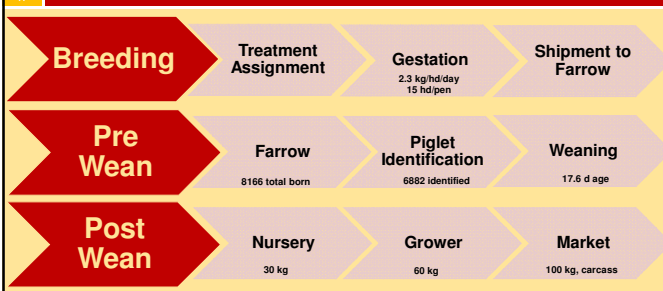

- Commercially reared pubertal gilts (n = 548) were divided into 4 diet by day of gestation (dg) treatments:
 - 0% additional ARG
 - Control (n = 143)
 - 1% additional ARG
 - Early, 15-45 dg (n = 138)
 - Full, 15 dg-Farrow (n = 139)
 - Late, 85 dg-Farrow (n = 128)

Materials and Methods- Maternal Diets

Diet Component	Trial Diets		NRC Req.- Total Basis (%)			
	Arginine	Control	Gilts (100-135 kg)	P1 (140 kg, <90d gest)	P1 (140 kg, >90d gest)	NRC Average
Dry Matter	87.63	87.46				
Crude Protein	16.30	14.88				
Alanine	1.00	1.02				
Arginine	1.28	0.65	0.34	0.32	0.42	0.36
Leucine	1.58	1.60	0.75	0.55	0.75	0.68
Lysine	0.78	0.75	0.74	0.61	0.8	0.72
Met+CYS	0.53	0.54	0.45	0.41	0.54	0.47
Methionine	0.26	0.26	0.22	0.18	0.23	0.21
Phenylalanine	0.69	0.70	0.45	0.34	0.44	0.41
Threonine	0.53	0.53	0.51	0.46	0.58	0.52
Tryptophan*	0.12	0.12	0.13	0.11	0.15	0.13
Valine	0.68	0.69	0.51	0.45	0.58	0.51

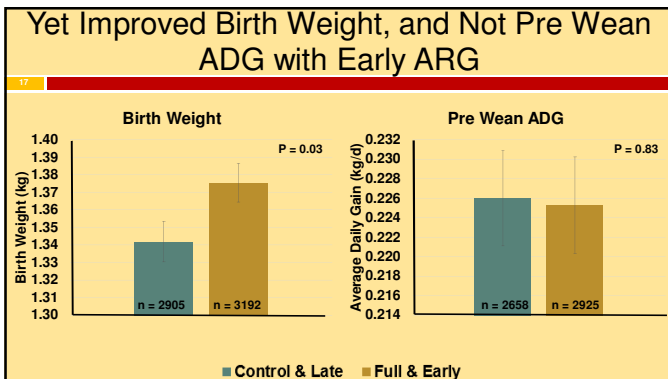

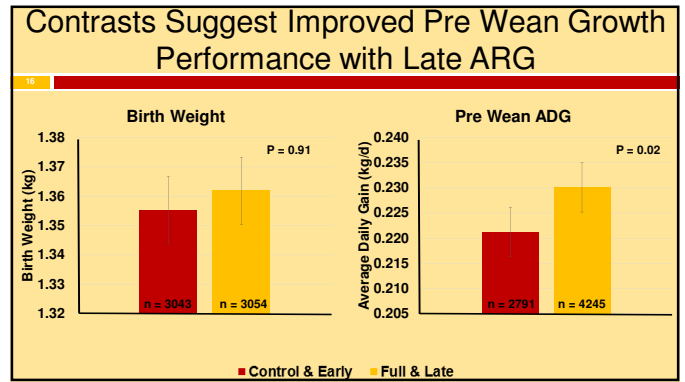

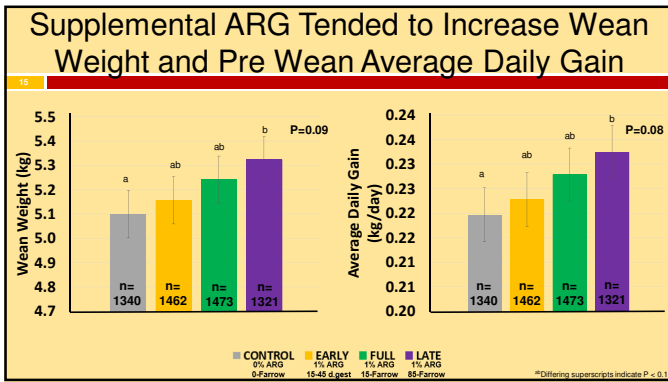

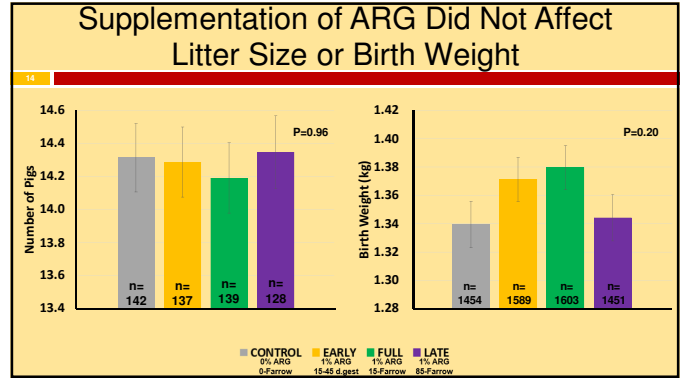

*Tryptophan as fed was 0.0045% lower than NRC, on average

Materials and Methods- Experimental Flow

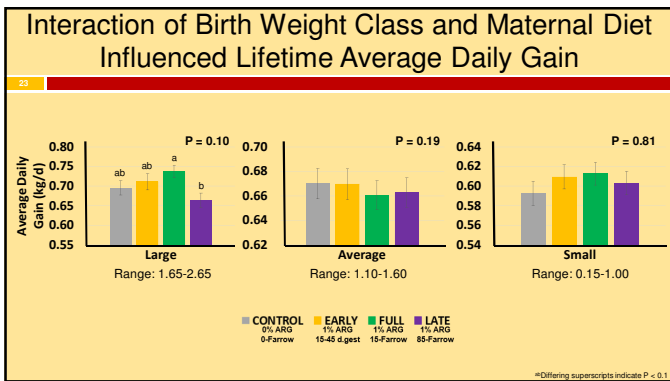

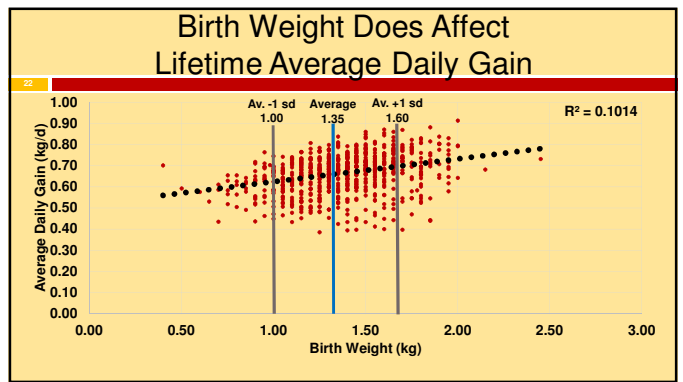

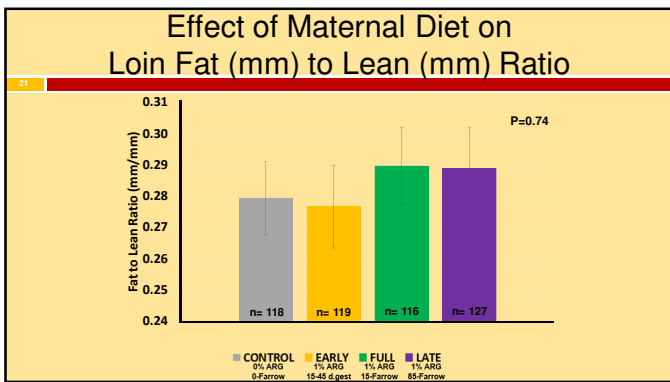

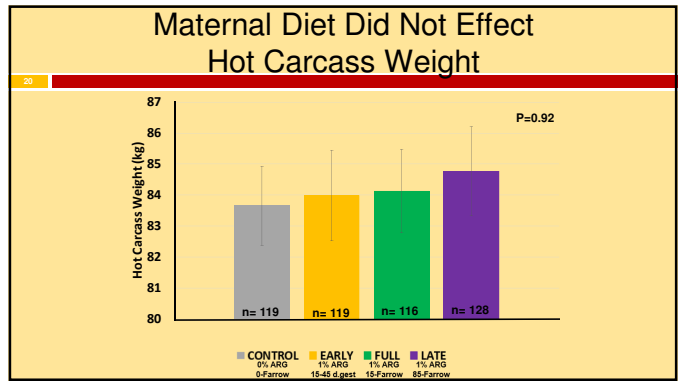

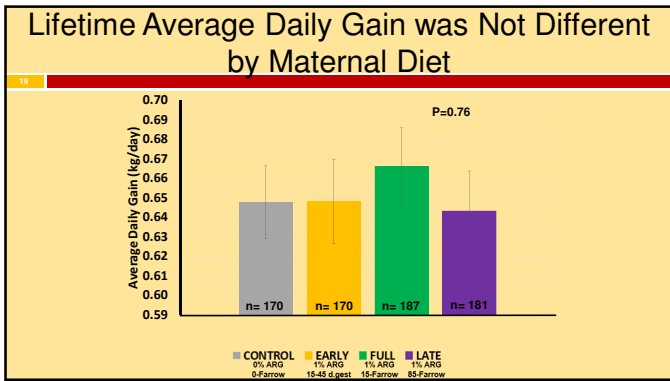

Statistical Analysis

- Statistical analyses (SAS 9.0, Cary, NC) were performed on gilt and offspring performance
 - Cross foster events were removed for offspring growth performance parameters
 - All offspring growth performance analyzed using birth weight and weaning weight age as covariates
 - Gilt and gestation pen utilized as a random effect

Post Wean Growth Performance was Not Different by Maternal Diet

Average Daily Gain, kg/d	CONTROL	EARLY	FULL	LATE	SEM	P value
30 kg Target	0.41	0.41	0.42	0.41	0.02	0.83
60 kg Target	0.80	0.76	0.79	0.81	0.03	0.16
100 kg Target	1.00	1.03	1.02	1.00	0.04	0.76

- ### Summary
- Supplementation of ARG did not effect litter size or birth weight
 - Individual wean weights and pre wean average daily gain
 - ▣ Tended to increase, late gestation ARG
 - ▣ Maternal ARG supplementation did not affect post wean growth or carcass performance
 - Birth weight improves overall growth performance
 - ▣ Birth weight classification increased strength of relationship

Conclusions

- Maternal supplementation of additional ARG, at 1% inclusion
 - ▣ Particularly pre wean performance, Late gestation ARG
 - ▣ Future exploration of mammary development to lactation
- Intensive data collection and further controlled analysis
 - ▣ Revealed improvements not easily observable in standard production data
 - ▣ How can we translate academic data into commercially relevant results
